

158 I. ABSTRACT OF THE DISCLOSURE

159 An apparatus and method for holding an object by a one-piece clip includes the use of a base
160 (101) having an opening (107) and a top member (113) having a grasping end (115) that extends into
161 the opening (107) are described. The clip includes a bendable fulcrum (111) that elastically connects
162 the base (101) to the top member (113). Tension produced by a bent bendable fulcrum (111) is
163 utilized to hold the object between a base grasping end (103) and the top member grasping end
164 (115). The one-piece clip can be manufactured by injection molding of a thermoplastic.
